

ABSTRACT

Electronic information is made more readily available to an access requestor based on an anticipated demand for the electronic information using a process, system or computer software. For instance, future requests for access to selected electronic information that is stored on a source storage medium are anticipated based on various criteria. Selected electronic information from within the source storage medium is accessed and duplicated on a destination storage medium that is more accessible to an access requestor than the source storage medium. The access requestor is thereafter provided with access to the selected electronic information that has been duplicated on the destination storage medium.
